

Feed Feature Specification

1. What the Feature Is

The feed is the central discovery layer of the application. It dynamically loads curated movie and TV content from external sources, organizes it into categories, and presents a polished homepage experience.

2. Categories

The feed consists of the following sections:

- Top Rated
- Trending
- Popular
- Upcoming
- Trending This Week
- Daily Picks
- Similar Movies (contextual, based on searches or viewed items)
- Recommendations (basic, tied to user preferences and watch history)

3. User Stories

- View homepage feed with multiple curated categories.
- Access movie details directly from feed items.
- Navigate between categories seamlessly.
- See refreshed content without manual reload.

4. Business Rules

- Each category limited to a fixed number of items (e.g., top 20).
- Feed data refreshes periodically (e.g., every 12 hours).
- Cached data persists until the next refresh cycle.
- Same movie should not appear twice within a single category.
- Personalized recommendations only available for logged-in users.
- Daily Picks are unique per day and rotate automatically.

5. External Dependency

- TMDB API provides all movie and TV data.
- Local database acts as cache for feed categories.
- Refresh cycle ensures balance between freshness and performance.

6. MVP Scope

Includes feed categories, caching logic, homepage data delivery, and basic navigation.
Excludes social features, advanced personalization, and activity feeds.
