

Watch Log Feature Specification

1. What the Feature Is

The watch log is a record of every time a user has watched a title. Unlike the watchlist, which tracks intent and status, the watch log tracks history. A title can be logged multiple times to support rewatches.

2. How Logging Works

When a user marks a title as watched from its detail page, a log entry is created automatically.

Each log entry records the title and the date it was watched.

If no date is specified, the current date and time is used.

Logging a title also updates its watchlist status to Watched if it is already in the watchlist.

If the title is not in the watchlist, the log entry is still created without any issue.

3. Core Actions

- Mark a title as watched from its detail page.
- View the full watch log as a chronological list.
- Delete a specific log entry.
- See the poster, title, release year, type, and watch date for each entry.
- Navigate to a title's detail page from the log.

4. User Stories

- Keep a record of everything watched and when.
- Log a rewatch of a title that has already been seen.
- Remove an incorrect or unwanted log entry.
- See watch history feed into the dashboard activity view.

5. Business Rules

- Only signed-in users can create or delete watch log entries.
- A title can be logged more than once.
- Deleting a log entry does not change the watchlist status for that title.
- Log entries are ordered by watch date, most recent first.
- The watch date can be set by the user or defaults to the current date and time.
