

Watchlist Feature Specification

1. What the Feature Is

The watchlist is a personal list where users save movies and TV shows they want to watch or have already watched. It is private to each user and persists across sessions. Users can manage their list from the watchlist page or directly from feed and detail pages.

2. Item Statuses

Every item in a watchlist has one of two statuses:

- Want to Watch: the user has saved the title but not yet seen it.
- Watched: the user has marked the title as seen.

Users can move items between these two statuses at any time.

3. Core Actions

- Add a title to the watchlist from a feed card, a detail page, or a search result.
- Remove a title from the watchlist entirely.
- Mark a title as watched.
- Move a watched title back to Want to Watch.
- View the full watchlist with poster, title, release year, and current status.
- Filter the watchlist to show all items, only Want to Watch, or only Watched.

4. User Stories

- Save a movie or show to come back to later.
- Keep track of everything already seen.
- Quickly find a specific title by filtering the list.
- Navigate to a title's detail page directly from the watchlist.
- See at a glance how many titles are saved and how many have been watched.

5. Business Rules

- Only signed-in users can add to or modify a watchlist.
- A title can only appear once per watchlist. Adding a duplicate shows an error.
- Removing a title from the watchlist does not delete any watch logs for that title.
- Status changes take effect immediately.
- Users who are not signed in and try to bookmark a title are prompted to log in.
